Recipe Finder App

Build a simple web app where users can:

- Search for recipes by name (e.g., "Pasta", "Salad").
- View a list of matching recipes with image, title, and short description.
- Click a recipe to view more details (ingredients and cooking steps).

Extras:

1. Add a loading spinner when fetching data.
2. Show an error message if no recipes are found.
3. Nice CSS styling

API Suggestions :
